Definition. tay, mareels and moore (1997) defined settling time as "the time required for the response curve to reach and stay within a range of certain percentage (usually 5% or 2%) of the final value." In scienza dell'automazione, il controllo automatico di un dato sistema dinamico (ad esempio un motore, un impianto industriale o una funzione biologica come il battito cardiaco) si prefigge di modificare il comportamento del sistema da controllare (ovvero delle sue "uscite") attraverso la manipolazione di opportune grandezze d'ingresso. Overview. rise time is an analog parameter of fundamental importance in high speed electronics, since it is a measure of the ability of a circuit to respond to fast input signals. there have been many efforts to reduce the rise times of circuits, generators, and data measuring and transmission equipment.
